Current Position		

Scientific interests

The main focus is set on (i) new thin film deposition techniques for semiconductors used for photovoltaic applications and based on chemical vapour transport, (ii) preparation and characterization of novel photocatalysts and photoelectrode materials, and (iii) the surface and interface analysis. Special attention is paid to electronic and structural properties. A long-term experience exists in the field of synchrotron radiation-related spectroscopic techniques in particular in-situ (operando) methods like X-ray absorption and photoelectron spectroscopy. He was the responsible scientist of the BMWi-project "Entwicklung einer neuen Dünnsschichttechnologie für die Photovoltaik: Technische Umsetzung des CCSVT-Verfahrens am Beispiel von Cu(In,Ga)Se₂-Solarzellenbasis-Materials" combine-project with AIXTRON AG. He was a project partner of the BMBF-Excellence cluster „Light2Hydrogen“-<http://light2hydrogen.de/> (2009 - 2014) and currently he is the initiator and project head of a consortium with 4 partners embedded in the DFG-priority program SPP1613 “-SolarH₂”. Additionally, he is coordinating a project for the realization of a novel Scanning Transmission X-Ray Microscope designed especially for in-situ Studies in the soft-X-ray range (100 eV – 1200 eV) at the Synchrotron radiation source BESSY-II.
